

Asphalt Institute Airfield Pavement Program

62nd Annual Conference and Business Meeting Kalahari Resort Nov. 30, 2021
 Mark D Blow, P.E. – Sr. Reg. Engineer

Outline

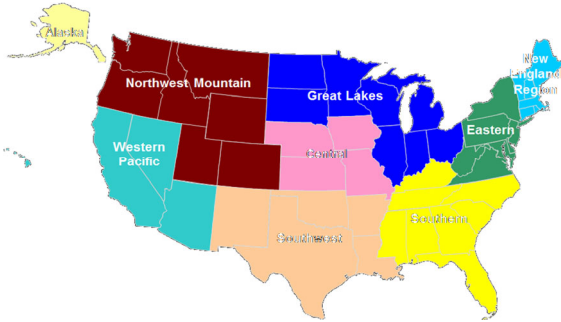

- Size of Airfield Market
- Airfield Challenges
- 3-Day APTW Discussion
- 1 ½ Day APC Discussion
- Specs for Airfield Paving
- Recent Changes to P-401
- Cutting Back Longitudinal Joint

ARP Regional Divisions

There are 9 Airports Regional Offices, of which 6 larger offices also have field facilities called Airports District Offices (ADOs). The other 3 Regions are standalone and are structured to provide both Regional and ADO services.

Great Lakes Airports

- 8 States
- 636 airports
 - 12 hubs
 - 70 Commercial Service (passengers)
 - 800+ paved runways
- Region with most in the country

FAA Airport Pavements in US National Plan of Integrated Airport Systems (NPIAS)

	AREA (million sy)	~14' wide Lane Mile	Overall %
RW	273	~33,000	59.4
TW	105	~13,000	22.8
Apron	81	~10,000	17.6
Total	460	~56,000	100.0

Credit Doug Johnson, FAA

For Comparison: U.S. Interstate System has 226,304 Lane Miles
 FHWA Table HM-60 - Highway Statistics 2017

Approximately 80% of RWs are asphalt
 - General Aviation (50%): 7:1 HMA/PCC
 - Primary (38%): 2:1 HMA/PCC

Most AIP \$ is spent on Pavement

Example:
 2017 Overall FAA Grants
 • \$3.2B Total AIP
 • >50% Airside Pavements ~\$1.7B

Two AI Courses Specific to FAA Standards

3 days on wide variety of topics, including pavement design/evaluation, materials, mix design, construction, preservation and rehab for airports.

- Offered in Fall each year

1.5 days focusing on P-401

- Offered several times per year
- Next offering to be virtual in Spring of 2022

AI / FAA Workshop Mission

Provide state of the art technical info. on airport asphalt pavements

- Necessary for:
 - Design
 - Construction
 - Maintenance /Preservation /Rehab

All presentations customized to airport pavements, and all reflect latest FAA guidance (ACs and errata)

APTW Background

- Workshops started in 1999
 - 2 offerings per year
- AI and FAA have partnered throughout this time to conduct each offering
 - Also reliant on regular contingent of outside experts as speakers
- Locations rotated among FAA Regions
- One 3-day APTW per year, Oct-Nov

3-Day Workshop Overview

AI Training in 2020 with COVID

- **Converted to all virtual offerings**
 - vAPTW in Oct 2020
 - vAPC in May 2020 and Mar 2021
 - Same content as in-person offering
 - 3 to 3.5 hours per day (typical)
- **Starting Fall 2021**
 - Offer some in-person and some virtual
 - vAPTW in Nov 2021
- **2022 plans**
 - One APC and one APTW

So why the need for a special FAA Workshop?

9 – AC's (FAA Advisory Circulars)

- 150_5320_6E Airport Pavement Design & Evaluation
- 150_5320_17A Surface Evaluation and Condition Rating
- 150_5335_5C PCN Reporting
- 150_5370_2F Operational Safety During Construction
- 150_5370_10G Standard for Specifying Construction of Airports
- 150_5370_10G Standard for Specifying Construction of Airports
- 150_5370_13A Offpeak Construction
- 150_5380_6C Guidelines & Procedures for Maintenance
- 150_5380-7B Airport Pavement Management Program (PMP)
- FAA Advisory Circulars Required for Use in AIP Funded and PFC Approved Projects

22 – EB's (FAA Engineering Briefs)

- EB_34A
- EB_42
- EB_56
- EB_57
- EB_57PWL
- EB_63b
- EB_64d
- EB_65a
- EB_66
- EB_67d
- EB_72a
- EB_73
- EB_74A
- EB_75
- EB_76
- EB_78
- EB_79
- EB_83
- EB_84_draft
- EB_87
- EB_89
- EB_91
- EB_92

Numerous Spreadsheets, Manuals and Supporting Doc's

- AC1000-P401-PWL-5370-10G-9-18-2014
- F806FAA
- Flexible Pavement Design Example
- Flexible Pavement Design Manual
- old 5370-10F P-401 Payment Adjustment for Densities and Air Voids
- PC1000_PCC Payment Factor for Strength and Thickness
- R805FAA_Rigid Pavement Design
- Rigid Pavement Design Manual
- 2001 Preventive Maintenance Guidelines
- Asphalt-Surfaced-Airfields-Distress-Manual
- Concrete-Surfaced-Airfields-Distress-Manual
- ISSA A105_Slurry Seal Guidelines_FEB2010
- ISSA A143_Micro Surfacing Guidelines_FEB2010
- Laboratory Accreditation
- Mixture Selection Guide 2001
- MOS Orlando IAP
- MOS Rock County Airport
- MOS Stevens Point Municipal, WI
- Sawcut and Seal Details-LaDOT
- Selecting PM Treatment Jun 2000
- TxDOT Pavement Mgmt Handbook

These items are all tied up into 31 Presentations

- Ref No 1 - Workshop Overview and Introduction
- Ref No 2 - FAA Overview.Regional Airport System
- Ref No 3 - Airport Terminology
- Ref No 4 - Overview FAA Update
- Ref No 5 - Airport Pavement Evaluation & Design
- Ref No 7 - Airport Pavement Thickness Design-FAARFIELD2
- Ref No 8 - Class Exercise 1 - Flexible Pavement Design Using FAARFIELD2
- Ref No 9 - Class Exercise 2 -HMA Overlay Design Using FAARFIELD2
- Ref No 10 - ACR PCR Concepts
- Ref No 11 - Asphalt Binder Selection
- Ref No 12 - Aggregates
- Ref No 13 - HMA Mix Design for Airport Pavements
- Ref No 14 - Exercise - Review of Contractor Mix Design Submittal
- Ref No 15 - Contractor Quality Control
- Ref No 16 - Owner Acceptance_PWL
- Ref No 17 - Pay Factor Exercise
- Ref No 18 - Prime Coat Milling Patching
- Ref No 19 - Tack Coat
- Ref No 20 - Paving Operations
- Ref No 21 - Compaction
- Ref No 22 - Longitudinal Joints
- Ref No 23 - Void Reducing Asphalt Membrane
- Ref No 24 - Runway Surface Considerations
- Ref No 24a - Runway Surface Considerations
- Ref No 25 - Airport Pavement Management Concepts
- Ref No 26 - Decoding FAA Surface Treatments
- Ref No 27 - Fog Slurry and Microsurfacing
- Ref No 28 - Gilsontite and Coal Tar Surface Treatments
- Ref No 29 - Fuel Resistant Asphalt Mixtures
- Ref No 30 - Crack Sealing
- Ref No 31 - Rehab of PCC with HMA

10 Presenters in our last APTW

Pavement Design Advisory circulars

The image shows two screenshots of FAA Advisory Circulars. The top screenshot is for AC 150-5320-6E, titled 'Airport Pavement Evaluation & Design Concepts - Part 1 & Part 2'. The bottom screenshot is for AC 150-5320-6G, titled 'FAA Pavement Design'. Both documents are presented in a professional layout with clear headings and bullet points.

Example: New FAARFIELD 2.0, 2021

- [kwevz z z dl1srwhfk1f1ddjrv2surqfw21srw6dyhp hcw Vrv d1h0Surjtdp v21srwVrv d1h0 Ghwd1DwP IG 26 : 3 ; 2w1FchIG 26 ; 742DDUIIHOG 0535](#)
- FAA's airport pavement thickness design software
- Accompanying AC 150/5320-6G, Airport Pavement Design and Evaluation.
- Redesigned graphical user interface (GUI) with improved screen flow and explorer-based navigation.
- New 3D finite element computational library, FAASR3D (FAA Structural Response – 3D), written in Visual Basic.NET™.
- Supports new ICAO ACR-PCR system (planned to replace ACN-PCN).
- New graphical vehicle editor provides the ability to add, save and edit user-defined vehicles.
- Updated aircraft library.
- Ability to work with multiple jobs/sections at once.

Aircraft Loads vs Highway Loads

- Aircraft and vehicle wheel loads differ significantly
- Aircraft tires are inflated to much higher pressures than vehicle tires
- The combination of higher aircraft wheel loads and tire pressures requires higher load design approach, materials and construction methods
- Aircraft engines sensitive to damage from pavement debris

Airplane vs Truck vs Car

14-60,000 # tire / 150-255 psi 4,500 # tire /85-110 psi 1,000 - 1,200 # tire / 35-45 psi

Aircraft Loads vs Highway Loads

Keys to State Specs in lieu of P-403

P-403

State highway department specs **may** be used in lieu of this specification for:

1. Access roads, perimeter roads and other pavements not subject to aircraft loading
2. Stabilized base courses under Item P-501
3. Pavements **designed for aircraft gross weight of 30,000 pounds or less**

- Must have a demonstrated satisfactory performance record under equivalent loadings and exposure.
- If density requirement is not specified, it shall be modified to include 403 requirements
- Include all applicable/approved state specifications

The use of state highway specifications for pavements subject to aircraft loading greater than 30,000 pounds and less than 60,000 pounds requires a MOS

A. P. Terminology and Distress ID

Airport Pavement Terminology and Distress Identification

John Dowd, PE
Dowd Engineering LLC
FAA/AI Airport Pavement Technical Workshop

AC 150/5370 - 10H

- Part 1 - General Provisions
 - Section 10 - Definition of Terms
- AC - Advisory Circular
- EB - Engineering Brief

DISTRESS IDENTIFICATION

AC 150/5370-10H Key Definitions

- 10-19 CONTRACTOR
- 10-25 ENGINEER
- 10-37 OWNER
- 10-48 QUALITY ASSURANCE
- 10-48 QUALITY ASSURANCE INSPECTOR
- 10-49 QUALITY ASSURANCE LABORATORY
- 10-50 RESIDENT PROJECT REPRESENTATIVE
- 10-55 SPONSOR

AC 150/5370-10H Outline

- Part 2 - GENERAL CONSTRUCTION ITEMS
 - C-160 Contractor Quality Control Program (CQCP)
 - C-110 Method of Estimating PMS
- Part 3 - SITEWORK
 - P-102 Excavation and Embankment
 - P-104 Subbase Course
- Part 4 - BASE COURSES
 - P-209 Aggregate Base Course
 - P-209 Crushed Aggregate Base Course
- Part 6 - FLEXIBLE PAVEMENTS
 - P-401 Asphalt Mix Pavement
 - P-403 Asphalt Mix Pavement Base Course
 - P-404 Fuel Resistant Asphalt Mix Pavement

Foreign Object Debris - FOD

FOD is any object, live or not, located in an inappropriate location in the airport environment that has the capacity to injure aircraft or air carrier personnel and damage aircraft.

FOD can be:

- Lane hardware
- Pavement fragments
- Catering supplies
- Building materials
- Rocks
- Sand
- Luggage
- Waste

AC 150/5210-24

Construction Safety

- See FAA Advisory Circular 5370-2 for help
- FAA § - Construction Safety Phasing Plan required

Workshop Overview

APC - Started in 2019

- Offer new 1.5-day Airport Paving Clinic (APC)
- Deep-dive into just the P-401
- Material specs, construction guidance, quality control and acceptance testing requirements
- 1 or 2 offerings per year
- All the APC content is part of APTW

Airfields provide unique pavement challenges different from highways

Heavier Loadings
aircraft loads can exceed 1M# vs. 160,000# max load on hwy/bridges

Higher Tire Pressures
can exceed 300 psi vs. semi truck ≈ 100 psi

Foreign Object Debris (FOD)
must keep airfields at higher serviceability level

FOD is Real !!

The GE-90 Engine used on Boeing 777's costs ???

\$24M !!

- Airfield HMA Specifications
 - FAA P-401 (today's focus)
 - Tri-service UFGS 32 12 15.13 (under WBDG)
- -- Many similarities between the two, few differences
- Generally Mandated if Federal Funds Used
- Language Must Apply Across the Country

Class Exercise PWL Calculation

John Duval, PE
Duval Engineering LLC

Documents

1. Pay Adjustment for Densities & Air Voids
2. FAA AC 150/5370-10H – Section 110
3. FAA AC 150/5370-10H – Section P-401

DETERMINATION OF PERCENT WITHIN LIMITS AND LOT PAY FACTOR FOR MAT DENSITY

Step 1: Lot Average

- Lot average (X)
- $X = (x_1 + x_2 + x_3 + \dots + x_n) / n$
- $x_1, x_2 =$ individual subplot values
- $n =$ number of sublots
- Example:
- $X_L = (90.70 + 94.17 + 91.57 + 94.83) / 4$
- $X_L = 92.82$

Step 4: PWL for the Lot

- Determine PWL using Table 1 in Section 110
- Enter Table 1 with $Q_c = 0.51$ and $n = 4$
- Table 1 Table for Estimating Percent of Lot Within Limits (PWL)

Percent Within Limits	Lot Pay Factor
90.00	0.60
91.00	0.65
92.00	0.70
93.00	0.75
94.00	0.80
95.00	0.85
96.00	0.90
97.00	0.95
98.00	1.00
99.00	1.00
100.00	1.00

PWL = 64%

Step 5: Lot Pay Factor

- Assign Lot Pay Factor from Table 6 in Section P-401
- PWL = 64

Percent of Pay Factor	Lot Pay Factor
60.00	1.4
65.00	1.4
70.00	1.4
75.00	1.4
80.00	1.4
85.00	1.4
90.00	1.4
95.00	1.4
100.00	1.4

Lot Pay Factor = 1.4(64) = 78%

DETERMINATION OF PERCENT WITHIN LIMITS AND LOT PAY FACTOR FOR AIR VOIDS

Steps 1 and 2: Lot Average and Std Deviation for Air Voids

- Lot average (X)
- $X = (x_1 + x_2 + x_3 + \dots + x_n) / n$
- Example:
- $X = (3.19 + 3.19 + 3.19 + 3.19) / 4$
- $X = 3.19$
- Lot standard deviation (S_n)
- $S_n = \sqrt{[(x_1 - X)^2 + (x_2 - X)^2 + \dots + (x_n - X)^2] / (n-1)}$
- $S_n = 0.84$

Beware FAA \$, strict standards!

• P-403 Density

403-5.2(b)(1) Mat density. Acceptance of each lot of plant produced material for mat density shall be based on the average of all of the densities taken from the sublots. If the average mat density of the lot so established equals or exceeds 96%, the lot shall be acceptable. **If the average mat density of the lot is below 96%, the lot shall be removed and replaced at the Contractor's expense.**

• P-401 PWL (% within limits)

Significant Changes to P-401, Dec 2018

- **Adjusted gradation bands**
 - matching military airfield specs
- **Improved minimum lift thickness guidance**
- **Tack coat as a separate pay item**
- **Contractor quality control**
 - greater emphasis, new requirements, separate pay item
- **New loaded wheel test requirement for mix design**
 - APA with 250 psi hose pressure at 64C
- **New guidance on PG grade selection**
 - additional grade bump
- **Compaction now % of TMD (vs lab bulk density)**
 - matches highway industry
- **Greater use of State highway standards**

On December 21, 2018, FAA released a new version of their Airport Construction Standards AC 150/5370-10G (released 2014)

~~AC 150/5370-10H~~

- P-401 just one of many specs in this AC (700+ pgs).
- Revision process includes extensive internal, industry and legal reviews (16 months, 2200+ comments). Thus, these ACs don't get updated frequently. Errata changes do occur.

Typical FAA Pavement Layers (for Flexible Pavements) and Their Specs in AC 150/5370-10H

- Surface Course
 - P-401 (asphalt mix)
 - P-403 (similar to P-401 but no PWL)
 - For pavements supporting aircraft <30,000 lbs, or shoulders, roads, blast pads, or small maintenance projects
 - P-404 (fuel-resistant asphalt mix)
- Stabilized Base Course (typically required for aircraft > 100,000 lbs)
 - P-403 (when used as bond-breaker)
 - P-304, P-306, P307 (various cement treated aggregate bases)
- Base Course
 - P-209 (crushed aggregate)
 - P-208 (aggregate, less crushed)
 - P-207 (full depth reclamation - New)
- Subbase
 - P-154 (coarse sand)

Significant Changes to P-401 (Dec 2018)

- Tack coat as a separate pay item
- Contractor quality control
 - greater emphasis, new requirements, separate pay item
- Compaction now % of TMD (vs lab bulk density)
 - matches highway industry
- Adjusted gradation bands
 - matching military airfield specs
- Improved minimum lift thickness guidance
- New loaded wheel test requirement for mix design
 - APA with 250 psi hose pressure at 64C
- New guidance on PG grade selection
 - additional grade bump
- Greater use of state highway standards

Covered in next Slides. Changes noted in red.

Changes to P-401 Mix Gradations (Table 2)

Sieve	Gradation 1	Gradation 2	Gradation 3
1 inch	100	--	--
3/4 inch	90 - 100	100	--
1/2 inch	68 - 88	90 - 100	100
3/8 inch	60 - 82	72 - 88	90 - 100
No. 4	45 - 67	53 - 73	58 - 78
No. 8	32 - 54	38 - 60	40 - 60
No. 16	22 - 44	26 - 48	28 - 48
No. 30	15 - 35	18 - 38	18 - 38
No. 50	9 - 25	11 - 27	11 - 27
No. 100	6 - 18	6 - 18	6 - 18
No. 200	3 - 6	3 - 6	3 - 6

P-401-3.3

Gradation bands adjusted to match UFGS 32 12 15.13, and be consistent with NMAS definition.

Gradation 2 is typical surface mix. Gradation 3 intended for leveling courses. Gradation 1 generally for non-surface mixes.

Slide 38

GD1 Gerhart, Danny, 3/28/2019

Changes to P-401 Mix Gradations

Table 2. Aggregate - Asphalt Pavements

	Gradation 1	Gradation 2	Gradation 3
Min. VMA	14.0	15.0	16.0
Asphalt percent by total weight of mixture:			
Stone or gravel	4.5 - 7.0	5.0 - 7.5	5.5 - 8.0
Slag	5.0 - 7.5	6.5 - 9.5	7.0 - 10.5
Recommended Minimum Construction Lift Thickness	3 inch	2 inch	1-1/2 inch

P-401-3.3

VMA now listed in Table 2. Criteria unchanged (1% higher than SP)

Min. Lift Thickness recommendation also added.

In Both P 401 and UFGS 32 12 15.13

Designer's option to choose between Marshall Hammer or Superpave Gyratory Compactor as Lab Compactor

New Loaded Wheel Test Requirement as Part of Mix Design - Designer Options

- **Primary Method—APA @ 250 psi**
 - AASHTO T340, 64°C, 250 psi hose pressure
 - Rutting must be < 10 mm @ 4,000 passes
 - **Alternative Method—APA @ 100 psi**
 - AASHTO T340, 64°C, 100 psi hose pressure
 - Rutting must be < 5 mm @ 8,000 passes
 - **Alternative Method—Hamburg Device**
 - AASHTO T324
 - Rutting must be < 10 mm @ 20,000 passes
- **Only Required on Projects for > 60,000# aircraft**
- Per Errata published on 11/12/19

Reference: AC 150/5370-10H

P-401 Calls for PG Grade (ASTM D 6373) and possible PG-plus test

Guidance in engineering note

- Determine "base grade" (based on climate only, no bumping for traffic), then bump per table:

Aircraft Gross Weight	High Temperature Adjustment to Asphalt binder Grade	
	All Pavement Types	Pavement area with slow or stationary aircraft
≤ 12,500 lbs	--	1 Grade
< 100,000 lbs	1 Grade	2 Grade
≥ 100,000 lbs	2 Grade	3 Grade

- Add PG Plus test if UTI is 92 or greater
 - Default is ER (ASTM D6084) 75% min*.
 - Errata note (Sep 2019): *Follow procedure B on RTFO aged binder
 - Engineer may replace ER with the local state DOT's PG-Plus test (and criteria).
 - Reference AI's binder spec database to see what each state uses

What about RAP or RAS?

- No RAP for surface mixes, except shoulders
- Max RAP is 30% for non-surface layers & shoulders.
- When using RAP:
 - 0-20% RAP, no change in binder grade
 - 20-30% RAP, adjust to one grade softer (HT and LT)
 - PG 64-22 adjusted to 58-28.
- No Recycled Asphalt Shingles (RAS)

Expanded Opportunities to Use State Paving Specs

- Airfields with aircraft ≤ 30,000 lbs - NO FAA-approved MOS required**
 - Used to be ≤ 12,500 lbs (under ...-10G)
 - About 30% of RWs in NPIAS rated below 30,000 lbs
- Non-primary airports > 30,000 and < 60,000 lbs**
 - Allowed with FAA-approved MOS
 - Due to FAA Reauthorization Act 2018
 - Current FAA sponsored research looking at performance of airfield projects built using state highway specs
- Other pavements not for aircraft loading: shoulders, perimeter roads, blast pads, vehicle roads and parking. Also stabilized base under PCC**

P-404 Fuel-Resistant Mixture

- Per FAA, use only as surface course (1.5" - 3" thick) where fuel resistance needed
 - On aprons to replace PCC or coal tar sealers
 - Some airports have used P-404 on RWs and TWs prone to rutting
- Properties**
 - 50-blow Marshall
 - Design air Voids: 2.5%
 - 9.5mm gradation
 - Weight loss from fuel immersion test < 1.5%
- Binder**
 - PG 88-22 or 92-28
 - ER > 85%
 - Separation test: max. temp diff. of 4 deg C (w/ ring and ball)

Tri-services just released (Nov 2020) similar FR mix spec for airfields: UFGS 32 12 17.19

Preparation of Gyrotary Test Specimens

- Gyrotary Compactor**
 - 600 kPa
 - 30 RPM
 - 1.25° Angle
- Compact with 50 or 75 gyrations
 - < 60,000 lbs = $N_{des} = 50$
 - ≥ 60,000 lbs = $N_{des} = 75$

6" Diameter Mold

Airfield specs require cutting back the longitudinal joint.

> 401-4.14 Joints

- LJs shall be cutback if exposed >4 hrs, or if surface <175 deg F, or if irregular, damaged, uncompacted, etc.
- With cutting wheel (typical) or pavement saw (not typical)
- Cut back max of 3" for clean, sound, uniform vertical face full depth
- Remove cutback material
- Tack LJ face per P-603

Cutting Back Joint

- Why: Eliminates low density material
- Avoid tearing
 - must cut when mix still warm (temperature sweet spot)
 - watering cutting wheel may help
- Critical to cut straight (use stringline)
 - easier with long wheel base vehicle

Cutting Wheel

Equipment for cutting back joint

- Roller with cutting wheel attached to drum
 - operates on newly paved surface while mix is warm
- Grader
 - Operates on adjacent paving lane
 - Potential to cause rutting if on new mat that has not cooled
 - Some have cited easier to cut straight when cutting wheel attached to rear ripper versus blade between wheels
- Not recommended: short wheel base vehicles (i.e. skid steer)

Thule AFB, Greenland

Thule AFB, Greenland (video)

Fort Carson, CO (video)

P-401 Joint Density

- 401-6.1 Acceptance sampling and testing
 - d. (5) In-place Joint density
 - One core centered over LJ for each subplot
 - Joint density = bulk density divided by avg. TMD for lot
 - “For joints between two lots, use lower avg. TMD”
- 401-6.2 c. Acceptance criteria for joint density
 - PWL of lot >90: acceptable
 - PWL <90%: evaluate reason
 - PWL <80%: cease operations until figure out why
 - PWL <71%: lot pay factor reduced by 5%
- 401-6.3 PWL Acceptance limit for joint density
 - Lower limit: 90.5% (Table 5)
 - 90 PWL achieved when consistently producing average joint density of at least 92.5% with 1.55% or less variability

More on Longitudinal Joints

Not Airfield Specific

Resource: AI’s “L.J. Info” Webpage

- Based on workshop developed for FHWA and delivered to 45 State DOTs (2011 -2014)
 - Recommendations for roads, not airfields
- <http://www.asphaltinstitute.org/engineering/longitudinal-joint-info/>
 - Available for download:
 - Handout of workshop slides (180+)
 - Video of entire 4-hr Workshop in OH
 - Webinars
 - Project report
 - 5-page “Summary of Recommendations”
 - Magazine articles on project and findings

First Pass Must Be Straight!

String-line should be used to assure first pass is straight

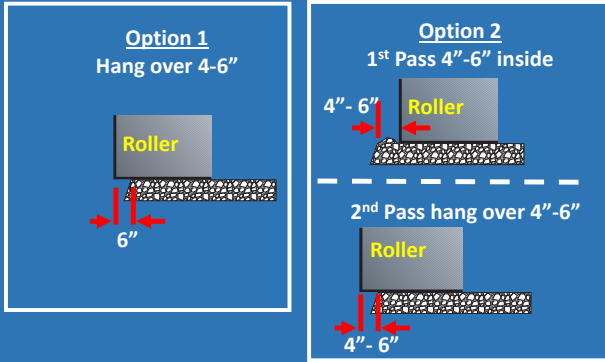

Stringline for reference, and/or Skip Paint, Guide for following

If not straight, impossible to get proper overlap (1”) with next pass

Rolling Unconfined Side?
50-50 on Where to Put 1st Pass

Paint the Side of Joint (Butt or Wedge)

When Closing Joint, Set Paver Automation to Never Starve the Joint of Material

- Target final height difference of +0.1" on hot-side versus cold side
 - NH spec requires 1/8" higher
- Joint Matcher (versus Ski) is best option to ensure placing exact amount of material needed
- If hot-side is starved, roller drum will "bridge" onto cold mat and no further densification occurs at joint

Bumping the Joint?

- Proper Overlap:
- 1.0 ± 0.5 inches
 - Exception: Milled or sawed joint should be 0.5 inches

Rolling Confined Side

1st pass entire drum on hot mat with roller edge off joint approx. 6-12"

2nd pass overlaps on cold mat 3-6"

Consider Pneumatic Rubber Tired Rollers

- Kneading action helps provide tighter surface that is more dense and less permeable compared to drum rollers.
- Keep away from unconfined edge to avoid excessive lateral mat movement
- Use during intermediate rolling of confined edge (not finish rolling)

Other Options / New Products

- Mill & Pave One Lane at a Time
- Echelon Paving
- Wider Paving Lanes
- Cut Back Joint
- Joint Heaters
- Intelligent Compaction
- Joint Adhesives (hot rubberized asphalt)
- Rubber Tire Rollers
- Surface Sealers Over Joint
- VRAM/ Longitudinal Joint Seal (LJS)

And Lastly, we all know

- Repairing RW or TW is Major Disruption to Ops
- Can't just close a lane and "keep traffic open"

Takes "Get In, Get Out, Stay Out" to Whole New Level

A.I. Airfield Training Opportunities

Asphalt Airfields

Seminar	Date	Location	PDHs
Airfield Asphalt Certification Program	JAN 25-28, 2022	Lexington, KY	24
Airfield Paving Clinic	TBA	ONLINE!	12
Airport Pavement Technical Workshop	TBA	ONLINE!	23

Our Fall 2021 APTW workshop just concluded on Nov 12

Our First offering of our brand new AACP will be offered in-person in Lexington, KY

Our next APC and APTW workshops have not yet been scheduled for 2022. Look for an APC clinic coming later next spring.

Thanks to AI Members.
